

Key Insights — Bike Sales Analysis

A data driven analysis of 1,000 bike shop customers

01 — Income Drives Bike Purchase Decisions

Analysis of 1,000 customers reveals that individuals who purchased a bike had a consistently higher average income compared to those who did not. Male buyers averaged approximately \$60,000 annually while female buyers averaged around \$55,000. Non buyers in both gender categories earned noticeably less. Marketing efforts should be targeted towards middle to higher income brackets for maximum conversion.

02 — Middle Aged Customers Are the Core Buyer Segment

Out of 1,000 total customers, 831 (83.1%) fell into the Middle Aged category (ages 31–54). This is the only group where purchases (425) outnumbered non-purchases (406), giving a conversion rate of 51.1%. Young Adults showed only 35.4% and Seniors just 28.8%. Marketing should primarily focus on the 31–54 age group.

03 — Shorter Commutes Drive Higher Bike Sales

Commute distance shows a clear relationship with bike purchase behavior. Customers living 0–1 miles from work had the highest purchase rate at 54.6% (200 out of 366). Those commuting 10+ miles had the lowest rate at just 29.7% (33 out of 111). Promotions targeting short distance urban commuters would yield the highest return on investment.

04 — Gender Income Gap Visible Across All Categories

A consistent income gap between male and female customers is visible throughout the dataset regardless of purchase decision. Despite earning less on average female customers still showed strong purchase intent. Income level appears to be a more significant factor than gender when predicting whether a customer will complete a purchase.

05 — Who Is the Ideal Bike Buyer?

- Age: Between 31 and 54 years old (Middle Aged)
- Income: Above average, approximately \$55,000 or higher
- Commute: Lives within 0–2 miles from their workplace
- Gender: Both male and female show strong purchase intent

Focusing resources on this segment is likely to produce the highest sales conversion rates based on the available data.
